

ARTIZONE PHASE 1 MVP — MINIMUM VIABLE PRODUCT SCOPE

Target: Live in 2-3 weeks | One developer (Node.js + PostgreSQL + React/Vanilla JS)

MVP Philosophy

Build the smallest system that replaces your current WhatsApp manual loop with automated booking capture + staff confirmation. Everything else (calendar, reporting, waitlist, packages) comes in later phases.

MVP Data Model (Subset of Full Schema)

Tables required for MVP:

1. **customer** — name, phone, whatsapp_optin
2. **service** — name, category, duration_min, buffer_min, price, active
3. **staff** — name, role, active
4. **staff_skill** — staff_id, skill (skin/body/laser/other)
5. **resource** — name, type (room/machine), active
6. **resource_capability** — resource_id, capability
7. **staff_availability** — staff_id, weekday, start_time, end_time
8. **appointment** — customer_id, service_id, staff_id, resource_id, start_at, end_at, status, source, notes, created_at
9. **appointment_event** — appointment_id, from_status, to_status, actor, created_at

Excluded from MVP: waitlist, packages/memberships, staff_time_off, notification table, demand reporting views.

MVP API Endpoints (8 endpoints)

Public (Customer-facing)

Method	Endpoint	Purpose
POST	/api/booking	Customer submits booking request. Creates appointment with status='requested'. Auto-calculates end_at = start_at + duration + buffer. Returns appointment ID.

Table 1 – continued

Method	Endpoint	Purpose
GET	/api/services	Returns active services list for the booking form dropdown.

Admin (Staff/Reception)

Method	Endpoint	Purpose
GET	/api/admin/dashboard	Returns: today' s metrics (total/pending/confirmed), pending requests queue, today' s confirmed schedule.
GET	/api/admin/appointments/:id	Full request detail with customer info, service, requested time.
PUT	/api/admin/appointments/:id/confirm	The core transaction: assigns staff_id + resource_id + final start_at/end_at, flips status to 'confirmed', writes appointment_event, triggers WhatsApp confirmation.
PUT	/api/admin/appointments/:id/decline	Status → 'declined', logs event, sends WhatsApp decline message.
GET	/api/admin/therapists-available	Query params: service_id, date, time. Returns staff who: (a) have matching skill, (b) are working that day/time, (c) have no confirmed overlap.
GET	/api/admin/rooms-available	Query params: service_id, start_at, end_at. Returns resources with matching capability and no confirmed overlap.

MVP Frontend Screens (3 screens)

Screen 1: Public Booking Form (embed on artizonespa.com)

- Fields: Name, Phone, Service dropdown, Preferred Date, Preferred Time, Notes
- Submit → POST /api/booking
- Success: “Request received. We'll confirm via WhatsApp shortly.”
- Mobile-first design (80%+ of your traffic)

Screen 2: Admin Dashboard (password-protected)

- **Top row:** Metric cards — Today: X | Pending: Y | Confirmed: Z

- **Middle:** Pending requests queue — cards showing customer name, service, phone, requested time, source badge (web/phone/walk-in)
- **Actions per card:** [Confirm] → opens detail modal | [Decline] → with reason input
- **Bottom:** Today's confirmed schedule — time-ordered list

Screen 3: Confirm Modal (opens from dashboard)

- Customer info (read-only)
- Service dropdown (can override if customer was vague)
- Date picker + Time picker
- Therapist dropdown — populated from `/api/admin/therapists-available`
- Room dropdown — populated from `/api/admin/rooms-available`
- **Live validation bar:** Green “Maya and Room 2 are both free at 2:00 PM” or Red “Slot conflict — choose another time”
- Primary button: “Confirm & Notify on WhatsApp”
- Secondary: “Save as Pending” (don't confirm yet)

MVP WhatsApp Integration (Minimal)

One outbound template required:

- `booking_confirmation` — “Hi {name}, your {service} is confirmed for {date} at {time} with {therapist}. Reply CONFIRM to acknowledge.”

Implementation:

- Use WhatsApp Business Cloud API (Meta Business account required)
- Store phone in E.164: +962790412758 (drop leading zero, add +962)
- Send confirmation immediately on PUT `/confirm` success
- No inbound webhook for MVP — customer replies handled manually by staff

Setup checklist:

- Meta Business account
- WhatsApp Business API access
- Phone number verification
- Template approval (Arabic + English versions)
- Permanent access token

MVP Exclusion Constraints (Non-negotiable)

```
-- Prevent double-booking at database level
ALTER TABLE appointment ADD CONSTRAINT no_staff_overlap_mvp
    EXCLUDE USING gist (staff_id WITH =, tstzrange(start_at, end_at) WITH &&)
    WHERE (status = 'confirmed');
```

```
ALTER TABLE appointment ADD CONSTRAINT no_room_overlap_mvp
EXCLUDE USING gist (resource_id WITH =, tstzrange(start_at, end_at) WITH &&)
WHERE (status = 'confirmed');
```

These make race-condition double-bookings physically impossible.

MVP Success Criteria (Go/No-Go for Phase 2)

Criteria	How Measured
Customer can submit booking via artizonespa.com	Test submission, verify row in DB
Staff sees request in dashboard within 5 seconds	Real-time or polling (30s acceptable for MVP)
Staff can confirm booking with therapist + room	End-to-end test: submit → confirm → check DB status='confirmed'
Customer receives WhatsApp confirmation	Check phone, verify message received
Attempting double-booking is blocked	Two simultaneous confirm requests → one succeeds, one fails with 409
Dashboard loads in < 2 seconds	Lighthouse / Network tab
Mobile booking form works smoothly	Test on iPhone + Android

MVP Tech Stack Recommendation

Layer	Technology	Rationale
Database	PostgreSQL 14+	Exclusion constraints require Postgres + btree_gist
Backend	Node.js + Express	Lightweight, JavaScript ecosystem, easy to find devs
ORM/Query	node-postgres (pg)	Raw SQL for exclusion constraints; no ORM hides the magic
Frontend (Admin)	React + Tailwind CSS	Component-based, mobile-responsive, fast iteration
Frontend (Public)	Vanilla JS embed	Lightweight, embeds in any GoDaddy page via
Hosting	Railway / Render / DigitalOcean	\$5-\$20/month, Postgres included, easy deploy
WhatsApp Auth (Admin)	WhatsApp Business Cloud API JWT + bcrypt	Official, template-based, scales Simple password login for staff dashboard

MVP Estimated Effort

Task	Days
Database setup + schema deploy + seed data	1
API: booking submission + services list	2
API: dashboard + confirm/decline + availability queries	3
Frontend: public booking form (mobile-first)	2
Frontend: admin dashboard + confirm modal	3
WhatsApp integration + template setup	2
Testing + bug fixes + deployment	2
Total	15 days (3 weeks with buffer)

What Is NOT in MVP (Phase 2+)

- Calendar day/week view
- Waitlist system
- Packages/memberships redemption
- Automated reminders (24h/2h)
- Demand reporting/heatmap
- Staff time-off management
- Multi-location support
- Customer portal (view own bookings)
- Loyalty points integration
- Online payment

Post-MVP Roadmap (Quick Reference)

Phase	Duration	Focus
Phase 2	+2 weeks	Calendar view, staff time-off, automated reminders
Phase 3	+2 weeks	Waitlist, packages/memberships
Phase 4	+2 weeks	Reporting dashboard, demand heatmap
Phase 5	+2 weeks	Loyalty bridge, customer portal, online payment
